*CEFIC, European Chemical Industry Council*

The European industry has the ambition to become Climate Neutral by 2050 and is uniquely positioned at the heart of European manufacturing to contribute to realizing a climate neutral society. The 6 enabling pillars of the industry pathway will be the availability of a significant amount of renewable energy, the support of innovation, the leveraging of symbiosis between sectors, the development of infrastructure and a supportive financial and market framework. All these elements will have to integrate the fact that our industry is by nature a global industry, so international competitiveness needs to be preserved and investments encouraged. Through these pillars, it is worth stressing that The chemical industry has some specificities : we will always need carbon to produce chemicals , less emission means more energy, and the prominence of a relevant investment phasing. The European chemical industry players do appreciate the challenge they are facing and are now engaging in the transition.
